OneOfOnes  
revolutionises the way

people use NFTs

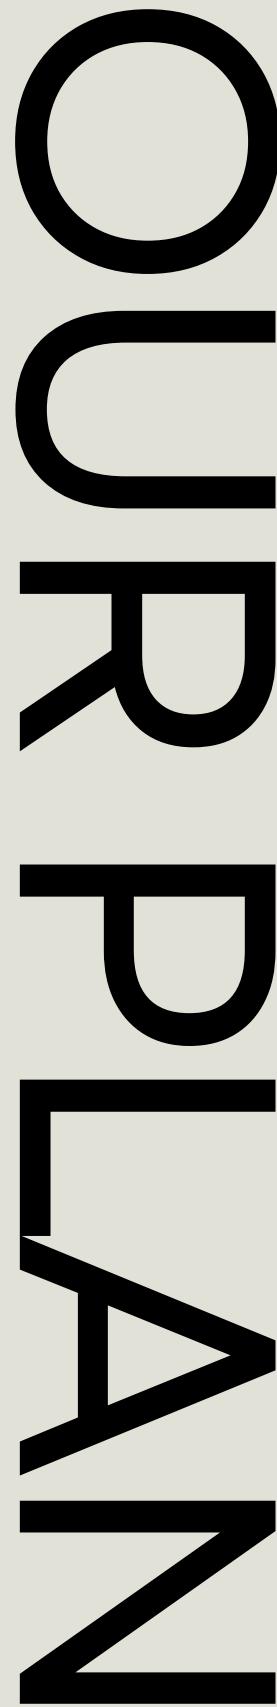

# INTRODUCTION

ONEOFONE

The NFT market is saturated with static JPEG collections—digital artwork that, once minted, is complete. We believe the future of digital ownership lies in assets that possess longevity, utility, and a narrative that evolves with time and verifiable data.

The One-of-One Dynamic NFT System is a platform built to enable creators and communities to deploy NFTs that are truly alive. These tokens change their appearance, traits, and metadata based on pre-set, real-world conditions, creating assets that are not just owned, but are actively experienced.

# Vision

Our strategy focuses on creating a new layer of scarcity defined by evolutionary states, not just initial traits.

- Core Protocol Development: Finalize the smart contract architecture on a low-cost, high-throughput chain that supports secure, external data consumption (Oracles/Keepers).

05

# Mission

- Strategic Partnerships: Collaborate with gaming studios, metaverse projects, and financial institutions to deploy novel use-cases for truly dynamic collateral or in-game items.
- Community First: Launch an exclusive "Genesis" collection utilizing the system to prove the concept and establish a base of engaged, long-term holders.

# PROBLEM

The current NFT market faces three major limitations:

- Static Nature
  - After the initial reveal, the asset holds no narrative tension; utility often peaks early and then fades.
- Lack of Utility Depth
  - Utility is often siloed (e.g., just an access pass) and doesn't integrate into the asset's core identity.
- Scarcity Erosion
  - High supply collections dilute rarity. The core problem remains: all tokens are fundamentally fixed at birth.

The result: Stagnant secondary markets, low holder retention, and a missed opportunity for NFTs to be truly functional, digital things, rather than just pictures.

# Solution

Our One-of-One system solves these problems by injecting verifiable life into the asset:

**CONTRACTS REFERENCE AN ORACLE FOR EXTERNAL DATA (E.G., TIME, API DATA) BEFORE RENDERING THE METADATA.**

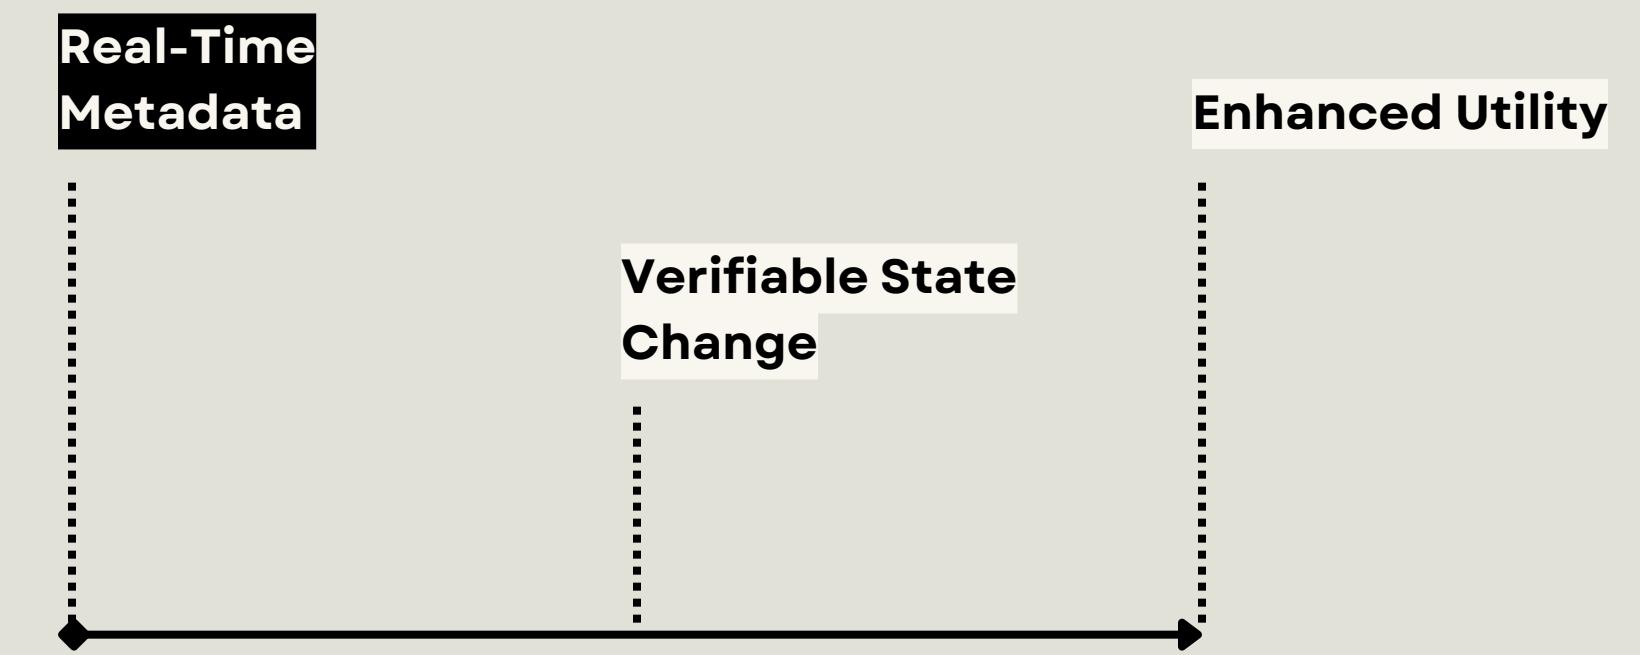

**ASSETS ARE CONTINUALLY UNIQUE; THEIR APPEARANCE REFLECTS CURRENT CONDITIONS.**

**ALL TRAIT EVOLUTION IS EXECUTED BY THE SMART CONTRACT, LOGGED ON-CHAIN, AND IS IRREVERSIBLE.**

**TRUSTLESS TRANSPARENCY AND PROOF THAT THE ASSET EARNED ITS CURRENT STATE.**

**THE NFT'S STATE CAN UNLOCK FEATURES. EXAMPLE: IF THE NFT'S "MOOD" TRAIT IS 'HAPPY,' IT GRANTS ACCESS TO A SPECIFIC PRIVATE CHANNEL.**

**UTILITY IS DIRECTLY TIED TO THE ASSET'S IDENTITY, INCREASING INTRINSIC VALUE.**

# Our Journey

- Our journey is focused on delivering a fully documented, extensible, and audited protocol
- Initial dynamic contract deployed on local dev-net. Proof-of-Concept working
- Refactoring code for optimal gas usage and preparing comprehensive test suite for security audit
- Creating a comprehensive developer guide and example front-end components for easy integration
- Deployment of the first 100-piece, community-governed collection using the V2 audited contract.
